MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

RE: MERCED, ASHLEY MELANIE
DOS: 03/28/2022
DOB: 03/08/1993
MRN: FC0011660

Referring physician: Dr. Higuera
Referring physician phone #: (347) 475-0078

CLINICAL INDICATION:

Right shoulder pain status-post motor vehicle accident.

TECHNIQUE:

T1, T2 axial and sagittal projections.

FINDINGS:

The acromioclavicular joint is intact. There is no fracture or edema of the distal clavicle. There is undersurface hypertrophy, which may be causing impingement.

There is increased signal in the supraspinatus and the infraspinatus tendons consistent with tendinosis and there is a partial tear of the bursal surface of the distal supraspinatus tendon near the attachment site. Fluid is present in the glenohumeral joint and the subacromial-subdeltoid bursa.

The humeral head is normal. There is no fracture or bone marrow edema. The anterior and the posterior labrum are intact. The inferior glenohumeral ligamentous complex is intact. The long head of the biceps tendon is normally situated in the bicipital groove. The visualized musculature is normal in signal intensity.

IMPRESSION:

1. Intact acromioclavicular joint with undersurface hypertrophy, which may be causing impingement.
2. Tendinosis of the supraspinatus tendon with partial tear of the distal bursal surface and fluid in the glenohumeral joint and the subacromial-subdeltoid bursa.
3. Intact biceps anchor complex. No fractures or acute labral tear.
