MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

RE: CLEMENTE, JAYSHAWN
DOS: 03/25/2022
DOB: 06/17/2000
MRN: FC0011654

Referring physician: Dr. Higuera
Referring physician phone #: (347) 475-0078

CLINICAL INDICATION:

Left shoulder pain status-post motor vehicle accident.

TECHNIQUE:

Multiplanar and multisequence images were obtained.

FINDINGS:

BONE MARROW AND OSSEOUS STRUCTURES: The bone marrow signal intensity is normal.

ACROMIOCLAVICULAR JOINT: Decreased signal is seen on the long TR sequence indicating discogenic changes possibly related to poor hydration within the nucleus pulposus of the disc.

ROTATOR CUFF: Focal, linear signal is seen on the long TR coronal sequence within the critical zone of the supraspinatus tendon, which does not reach the surface of the tendon, being completely within the substance of the tendon. This is most consistent with tendonitis of the supraspinatus tendon.

GLENOHUMERAL JOINT AND LABRUM: There is a 1.7 cm greatest diameter cyst in contiguity with the superior labrum. This likely represents a labral cyst.

BICEPS TENDON: The long head of the biceps tendon is of normal morphology, location and signal.

IMPRESSION:

1. The acromion is low lying.
2. Tendonitis of the supraspinatus tendon.
3. There is a 1.7 cm greatest diameter cyst in contiguity with the superior labrum. This likely represents a labral cyst.
