

MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

RE: BOLANOS MARIA P
DOS: 02/23/2022
DOB: 06/16/1951
MRN: FC0011477

Referring physician: Dr. Higuera
Referring physician phone #: (347) 475-0078

CLINICAL INDICATION:

Right shoulder pain status-post motor vehicle accident.

TECHNIQUE:

T1, T2 GE sequences in multiple projections

FINDINGS:

The acromioclavicular joint is narrowed with bony hypertrophy. There is no fracture or edema of the distal clavicle. There is high-grade partial tear of the supraspinatus tendon mainly involving the bursal surface of the tendon at and beyond the attachment site.

There is tendinosis and partial tear of the infraspinatus tendon mainly involving the undersurface. The subscapularis tendon is intact.

The humeral head is normal in position. There is no fracture or bone marrow edema. The long head of the biceps tendon is normally situated in the bicipital groove.

The anterior and the posterior labrum are intact. The inferior glenohumeral ligamentous complex is intact. The visualized musculature is normal in signal intensity. There is no subcutaneous mass or collection.

IMPRESSION:

1. Narrowing and hypertrophy of the acromioclavicular joint. No fracture or edema of the distal clavicle.
2. High-grade partial tear of the distal supraspinatus tendon and tendinosis and partial tear of the infraspinatus tendon with fluid in the subacromial-subdeltoid and subscapular bursa.
3. Intact biceps anchor complex. No fractures or acute labral tear.
