Pt Name: NUNEZ, JHAN Referring physician: Dr.Higuera
DOS: Mar 23, 2022 13:22:15
DOB: Jun 25, 2001
MRN: AR-220251

STUDY DESCRIPTION: MRI RT-SHOULDER

CLINICAL HISTORY: Pain.

TECHNIQUE: Multiplanar and multisequence images were obtained.

FINDINGS:

BONE MARROW AND OSSEOUS STRUCTURES: The bone marrow signal intensity is normal.

ACROMIOCLAVICULAR JOINT: There is productive change seen at the acromioclavicular joint, which is effacing the subdeltoid fat plane and encroaching on the supraspinatus muscle tendon complex.

ROTATOR CUFF: There is a partial tear of the supraspinatus tendon characterized by focally increased signal within the critical zone of the supraspinatus tendon that reaches the surface of the tendon on all pulse sequences. A trace joint effusion is present indicating the presence of a synovitis/bursitis.

GLENOHUMERAL JOINT AND LABRUM: There is no evidence of glenohumeral joint subluxation. The anterior labrum and the posterior labrum are grossly normal. The visualized portions of the superior, middle and inferior glenohumeral ligaments are normal.

BICEPS TENDON: The long head of the biceps tendon is of normal morphology, location and signal.

IMPRESSION:

1. Productive change at the acromioclavicular joint, which is encroaching on the supraspinatus muscle tendon complex.
2. Partial tear supraspinatus tendon.
3. Trace joint effusion.
